

PS's Ponderings

I love science. You know, for years it seems like science has been at war with Christianity. I once had a person tell me — in a Sunday School class by the way... "Only a moron would believe the world began the way the Bible describes it in Genesis 1." He was dead serious, and quite angry, as he shook his finger in my face. At the root of this perceived battle between scientific discovery, and a God as the Creator of all things, is Evolution.

A theory purposed by Charles Darwin in 1859, evolution became the primary weapon of a portion of the scientific community that was seeking to explain creation without God. Today it is still wielded for this purpose. Fascinatingly, Darwin would admit later in life that his theory did not work and contained a critical lack of evidence, most specifically, no evidence whatsoever of species to species evolving. The Big Bang, Evolution that began with a primordial soup containing the first proteins of life, humanity being simply the sum of caustic chance... all scientific ideas aimed at taking God out of the equation.

Today, most of the scientific atheist community no longer supports The Big Bang theory which states that when all of the chemical, matter and energy in the Universe was just right — it exploded into existence. Do you know why? Astronomers, using high powered telescopes like the Hubble Telescope and using a process known as Red Refraction of Light, have been able to measure the distances between our solar system and other Galaxies that are visible. Do you know what

they have found? Every Galaxy, and there are literally thousands, that are visible from Earth, are all traveling away from The Milky Way at a high rate of speed. Think of a pebble dropped into a bucket of water and the ripples radiating out from the splash... that is the idea.

For some scientists, it is a little too uncomfortable. In Genesis 1:3 we read, "*And God said, 'Let there be light' and there was light.*" And BOOM! According to Genesis, the Universe exploded into existence. Compelling isn't it? Every Galaxy visible to us is retreating... from little old planet earth.

Almost daily, geneticists are making breakthroughs in discoveries of the human genome. Research has
